

📌 Problem Statement – HealthAI Project

Access to reliable healthcare information is often **limited, delayed, or overwhelming**, especially for individuals in remote areas or those hesitant to visit a doctor for non-critical symptoms.

Many people resort to **online searches** or **unverified forums**, which can lead to:

- Misinformation and unnecessary panic,
- Delays in seeking professional care,
- Poor understanding of symptoms and treatment options.

Moreover, most existing symptom checkers lack **personalization, interactive support, and data-driven guidance**.

🔍 Identified Problem:

There is a clear need for an **AI-powered healthcare assistant** that can provide **instant, personalized, and medically-informed insights** in a user-friendly, conversational format — without replacing the role of a doctor but supporting better decision-making for everyday health concerns.
